Retail Sales Performance Analysis

Insights into Product Sales, Customer Purchases, and Revenue Trends

Prepared by:

Adeola Rhoda

Project:

Microsoft Excel Business Sales Analysis

Date:

March 2026

Project Overview

This report presents an analysis of retail sales data using Microsoft Excel. The purpose of the analysis is to understand sales performance across products, customers, and regions in order to support better business decision-making.

The dataset includes information on product sales, customer purchases, regional performance, and revenue generated from each transaction. By cleaning and analyzing the data, meaningful insights were extracted to help management understand business performance.

A dashboard was created to visually summarize the key findings and provide an interactive way to explore sales trends and patterns.

Dashboard Overview

The dashboard provides a visual summary of key business metrics including total revenue, average order value, and total customers. It also presents sales insights through product performance, customer purchasing patterns, and revenue trends over time.

Key metrics displayed on the dashboard include:

Total Revenue: ₦72,030

Average Order Value: ₦1,441

Total Customers: 50

These metrics help management quickly understand the overall sales performance of the business.

Retail Sales Performance Dashboard

Dashboard View Filtered by Region

The dashboard includes an interactive slicer that allows users to filter the data by region (East, North, South, and West). When a region is selected, the dashboard automatically updates to display the sales performance for that specific region.

This feature allows management to easily compare regional sales performance and identify areas where the business is performing strongly or where improvement may be needed.

Key Insights

Insight 1- Product Performance

Certain products contribute significantly more to revenue than others. Products such as electronics and laptops generate higher sales compared to other categories. This suggests strong customer demand for technology products.

Insight 2 – Sales Trend Over Time

The revenue trend over time shows fluctuations across different periods. Some days or months experience higher sales than others, which may indicate seasonal demand patterns or the impact of promotions and purchasing behavior.

Insight 3 – Customer Purchasing Behavior

Customers purchase a variety of products, but revenue contribution varies across customer types. Corporate customers tend to generate higher purchase values compared to consumer customers.

Regional Performance Analysis

Sales performance varies across the different regions included in the dataset. Some regions contribute a larger share of revenue, indicating stronger market demand in those locations.

Using the region slicer in the dashboard, it becomes easier to identify which regions generate the highest sales and which regions may require additional business focus.

Understanding regional performance allows businesses to:

- Improve marketing strategies in high-performing areas
- Develop growth strategies in underperforming regions
- Allocate resources more effectively

This regional analysis helps management make informed decisions about market expansion and sales strategies.

Business Recommendations

Based on the findings from the sales analysis, the following recommendations are suggested:

- **Focus on High-Performing Products**

Products generating the highest revenue should receive greater marketing attention and inventory support to maximize sales opportunities.

- **Improve Performance in Lower-Performing Regions**

Regions with lower sales may benefit from targeted promotions, improved distribution channels, or localized marketing strategies.

- **Monitor Sales Trends Regularly**

Tracking revenue trends over time can help the business identify peak sales periods and plan future campaigns accordingly.

- **Strengthen Customer Engagement**

Encouraging repeat purchases through loyalty programs and customer engagement strategies may help increase overall revenue.

CONCLUSION

This analysis provided valuable insights into the company's retail sales performance using Microsoft Excel. By cleaning and analyzing the dataset, key patterns were identified across products, customers, and regions.

The dashboard highlights important metrics such as total revenue, average order value, and customer activity, allowing users to quickly understand overall business performance. The interactive region slicer further enables management to explore sales performance across different geographical areas.

Overall, the analysis demonstrates how data visualization and dashboard tools can help businesses monitor performance, identify opportunities for growth, and support data-driven decision-making.
